

DRAGADOS

ENERGY POLICY

Energy requirements of today's society are experiencing a steady climb, especially in our activities of construction, conservation and maintenance of infrastructures, requiring, therefore, greater control and optimization of energy consumption at all stages of their life cycle and makes it imperative to take global awareness regarding climate change through a reduction in emissions to the atmosphere.

Dragados has a strong commitment to environmental protection and process efficiency, which positions it at the top of the sector, making it essential to promote rational use of energy within our organization by incorporating energy efficiency measures with the aim of reducing environmental impact and facilitating a transition to a low-carbon economy.

To achieve this, Dragados has implemented in its worksites an Energy Management System in accordance with ISO 50001 and demands going beyond mere compliance with current legislation, assuming voluntary commitments based on the following principles:

- a) Control energy use and improve energy efficiency.*
- b) Train our own staff and raise awareness among suppliers, clients and other stakeholders in energy matters to improve consumption habits.*
- c) Provide the necessary resources for continuous improvement and the achievement of the energy objectives set.*
- d) Propose to our customers, and accept from our suppliers, those sustainable alternatives that favor lower energy consumption.*
- e) Communicate to stakeholders all relevant information on energy performance.*

These principles reinforce the values of our company regarding respect for the environment, awareness and efficiency and should act as a guide and example in the development of our activities.
